Analysis Report for Products Consumed All over India

Objective Analysis:

The objective is to evaluate the performance of multiple products consumed over time using consumption data.The analysis mainly focused on which is the top🔝 and weak consumer product , Growth percentages% over time🕰️ and support in business taking decisions.

Data Types Used:

Data Type	Description
Rows	Time(Years , Months)and Sectors
Columns(D-Y)	Products names and its Growth percentages over time
Value	Products consumed and its index

Excel Formula used:

- ★ Total Products Consumed of Each product - =SUM(D2:D463)
- ★ Average Products Consumed - AVERAGE(D2:D463)
- ★ MAX Product Consumed - MAX(D2:D463)
- ★ MIN Product Consumed - MIN(D2:D463)
- ★ Growth % - (D3-D2/D2) New-Old/Old.
- ★ Top Product - INDEX+Match+MAX

Descriptive Analysis:

The dataset contains time-based index values for multiple products. Each row represents a time period, and each column represents a product's performance value. The data shows how product performance changes over time.The total values across products indicate the overall market activity level. The data shows that product performance is not equal; some products contribute significantly more than others. This suggests an uneven distribution of demand.

Products comparison:

By comparing products some have been highly consumed indicating high values and which have been lowest consumed indicating low values .We can say that business performances depend on these indexes.

Over Time ⏳ Comparisons:

The products which have highly consumed the values also increased over the period of time. And same goes for the low consumed products which decreased over a period of time.Hence we can say that product consumed value changes dynamically but not constant.

Stability vs Fluctuation:

Certain products show gradual and stable changes, indicating steady demand. Others show sharp increases or drops, indicating volatility or seasonal influence.

Q1. What is the total overall Products consumed of all the years ?

Ans Total overall products consumed of all years is **756540.5**

Q2.What is the Max product consumed and its Value ?

Ans. Vegetables and its value is **333.9**

Q3.What Growth percent of latest year total and previous year?

Ans. Latest Year vs Previous Year

Growth% = -8.06%

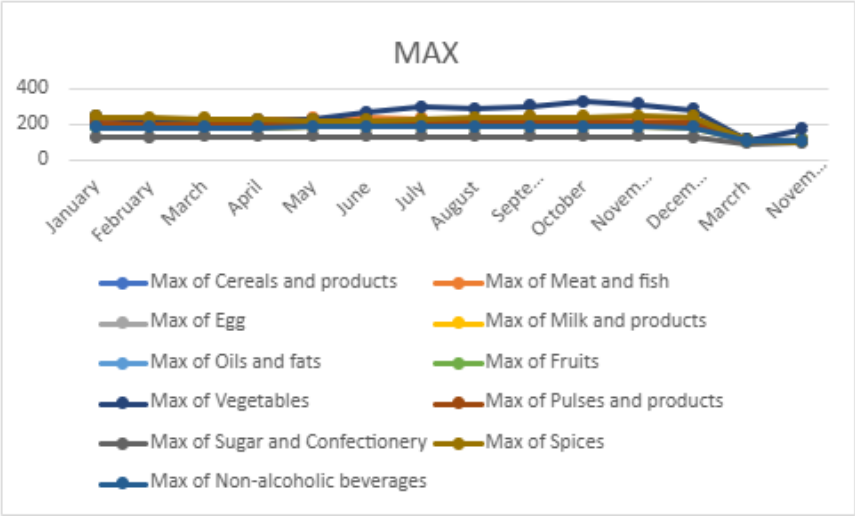
It means the overall products consumed has declined compared to previous year.

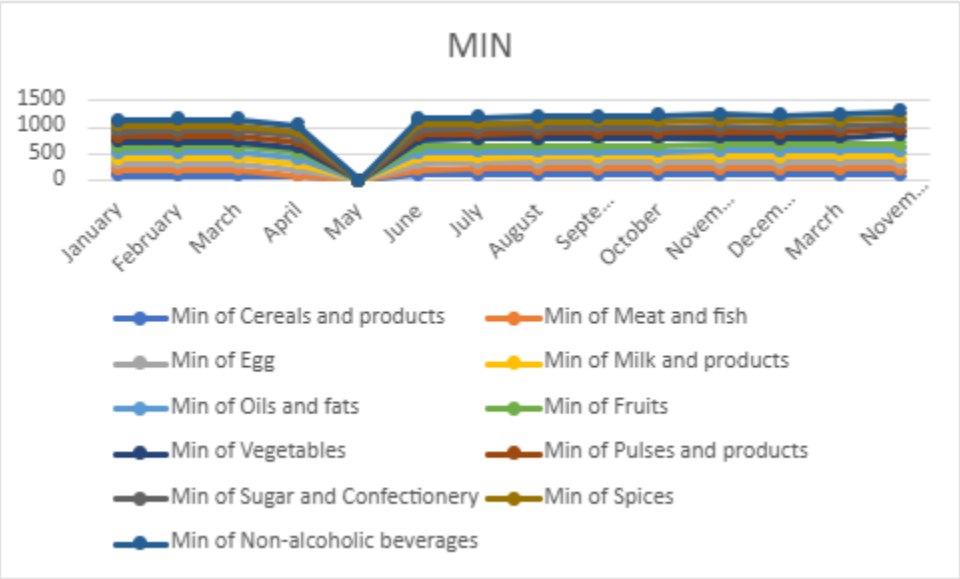
Q4.According to Dataset the pattern over period increasing or decreasing?

Ans Since the Total growth is negative the overall trend shows a declining pattern in the most recent period.

Q5.Which Month has Highest product Consumed and Lowest product consumed in month?

Ans





Q6.Which Product is best?

Ans. Best Consumed Product : **Meat 🥩and Fish 🐟** . It has the highest total index contribution.

Q7.Why is the sugar and confectionery low?

Ans. Lowest Consumption trend.

Derivative Analysis:

Derivative Analysis = Diagnostic Analysis

- Overall growth = –8.06% (decline)
  Best product = Meat & Fish
  Weak product = Sugar & Confectionery

Q1.Why the total Production decline?

Ans. Multiple Products have low growth percentage over time, some months also low index values ,Demand reduction in certain Products.

Q2.Why Meat and Fish are Top products?

Ans. Highest consistent index values , High demand over time and stable performance compared to others .

Q3.Why Sugar and confectionery low?

Ans. Low index values , reduced demand of sugar and Minimal Impact on Total Consumption over Time.

Q4.Why is growth unstable?

Ans. Some products increase while others decrease.Mixed trend causes fluctuations.Market behavior is **not uniform.**

Predictive Analysis:

Will total production increase or decrease?

Since recent overall growth = **- 8.06%**, and multiple products show declining patterns:**Prediction:** Total production may **continue to decline in the short term** unless demand improves**.**

Which products are likely to grow?

- Stable index value.
- Positive or small fluctuations
- Strong contribution

Likely growth categories:

- **Meat & Fish**
- **Milk & Products**

- **Cereals**

Which products are at risk of further decline?

Products with:

- Low index values
- Negative or unstable growth
- Low contribution %

At-risk products:

- **Sugar & Confectionery**
- Some seasonal vegetables/fruits categories

Will market demand be stable?

Mixed trends suggest:

- Essential food items → **Stable**
- Non-essential/health-sensitive items → **Fluctuating.**
- Overall market = **moderately unstable**

Risk Factors:

Heavy dependence on a few categories like Meat & Fish means: If that category drops → major overall impact..

PRESCRIPTIVE ANALYSIS REPORT

Based on:

Declining overall growth (–8.06%)
Meat & Fish = strongest category
Sugar = weakest category
Mixed product trends

Where should the company invest more?

The company should increase focus on **Meat & Fish** because it shows strong and stable demand. This category contributes significantly to overall performance and is likely to remain essential for consumers.Investment should also continue in **Milk & Milk Products** and **Cereals**. These are basic food items with consistent consumption patterns, making them low-risk and reliable for long-term stability.

Which products need close monitoring?

Products like **Fruits, Vegetables, and Pulses** should be monitored regularly. Their performance often changes due to seasonal demand, price fluctuations, and supply conditions. They are not weak categories, but their growth is unstable, so monthly tracking is necessary.

Which products should receive reduced focus?

Sugar & Confectionery appears to be a weaker-performing category compared to essentials. The business should avoid heavy investment here and instead control production levels. If decline continues, resources may be better allocated to stronger categories.

Other low-growth minor categories should also be reviewed quarterly to decide whether to continue, improve, or discontinue.

How to stop overall decline?

Strengthen supply chains for high-demand products
Run promotions for medium-performing categories.Reduce wastage in slow-moving products
Optimize pricing strategies

Risk Control Strategy

The business currently depends heavily on a few strong categories. This creates risk if those categories decline. To reduce risk, the company should diversify product focus and avoid over-dependence on one segment.

Data-based action rule for future decisions

If a product shows continuous positive growth, the business should expand production and marketing.
If a product is stable but not growing much, promotions and pricing strategies should be used to improve demand.
If a product shows continuous decline, the business should reduce focus, control costs, or consider replacing it.
